

Photovoltaic panel curvature

Overview

Our aim is to generate an approximation of a flexible panel that is bent over a double-curved surface, following the surface as closely as possible while remaining developable and resulting in an exactly rectangular shape when unrolled. As triangulated strips are perfectly developable, we decided to.

Although the method described in “Panel generation method A: congruent triangle shapes” does work for strips with changing curvature direction, it.

In order to assess the extent to which triangulation methods A and B reflect actual bending behaviour of sheet metal, we created a physical.

The amount of module bending and the accuracy of surface approximation are important metrics as they strongly influence buildability, detail design and visual appearance. We.

The methods shown above can be used to generate single strips, but in order to cover a larger area, a method to arrange multiple strips is needed. To.
