## Overview

---

How does Lightning affect a PV system?

After studying the influences of lightning strikes on the PV system and modeling methods, it is mandatory to design a protection system for the PV system during lightning. The lightning protection system (LPS) is used to protect the PV system from damage and service interruption.

How to protect PV panels during lightning strikes?

Therefore, an adequate lightning protection system (LPS) must be installed to protect the PV panels. In addition, the transient performance of PV panels during lightning strikes must be analyzed well. This paper presents a comprehensive review of the superior modeling methods of PV systems during lightning strikes.

Are PV systems vulnerable to lightning?

Similar to other power systems [ , , , , ], PV systems are vulnerable to lightning because they are always installed in unsheltered open areas. Recent studies on lightning protection of PV systems have drawn much attentions [ 9 ].

Why is accurate modeling of PV systems during lightning important?

The accurate modeling of PV systems during lightning is important for the proper selection of LPS. Some previous researches presented an overview of the PV system behavior during lightning, taking into account the LPS design and the effect of lightning on PV systems.

Do PV systems need lightning protection?

With all the barriers discussed in Section 3.3, the need for lightning protection on PV systems must be evaluated on the basis of the risk analysis and protection costs. Table 10 presents the recommended standards related to PV systems including PV installations, lightning protection systems and electrical installations. Table 10.

What is a lightning protection system (LPS)?

The lightning protection system (LPS) is used to protect the PV system from damage and service interruption. The LPS includes an air termination rod, earthing system, or surge protective devices, which provide an alternative path for lightning away from the PV system.
