Overview

How are PV panels inspected and photographed?

During the process of image collection, all four types of PV panels described in Sect. 2 are inspected and photographed when they are in operation. When taking the images, the camera was installed 0.6–1.0 m above the PV panels to simulate a scene where a drone carries the camera to monitor the PV panels.

How to extract PV panel area from crystalline silicon photovoltaic modules?

Both studies demonstrated that accurate PV panels area can be extracted using red, green, and blue band images. Therefore, we used RGB band information to extract PV panel information. The core part of crystalline silicon photovoltaic modules is the solar cell, which mostly appears in a deep blue color to enhance the absorption of sunlight [37].

How to detect PV modules using imaging spectroscopy?

Therefore, PV modules detection using imaging spectroscopy data should focus on the physical characteristics and the spectral uniqueness of PV modules. PV modules commonly consist of several layers, including fully transparent glass covers for protection, highly transparent EVA films, and the core PV cell.

What is the information gap in distributed solar photovoltaic (PV) arrays?

Here, we focus on the information gap in distributed solar photovoltaic (PV) arrays, of which there is limited public data on solar PV deployments at small geographic scales. We created a dataset of solar PV arrays to initiate and develop the process of automatically identifying solar PV locations using remote sensing imagery.

How intelligent image processing technology can improve PV panel condition monitoring?

The research of this paper is to address this issue with the aid of intelligent

image processing technology. In this study, an intelligent PV panel condition monitoring technique is developed using machine learning algorithms. It can rapidly process, analyze and classify the thermal images of PV panels collected from solar power plants.

What is physics based solar PV?

This physics-based approach is robust, transferable and operational. Over the past decades, solar panels have been widely used to harvest solar energy owing to the decreased cost of silicon-based photovoltaic (PV) modules, and therefore it is essential to remotely map and monitor the presence of solar PV modules.
