## Overview

---

The solar power plant is also known as the Photovoltaic (PV) power plant. It is a large-scale PV plant designed to produce bulk electrical power from solar radiation. The solar power plant uses solar energy to produce electrical power. Therefore, it is a conventional power plant. Solar energy can be used directly to produce.

The major components of the solar photovoltaic system are listed below. 1. Photovoltaic (PV) panel 2. Inverter 3. Energy storage devices 4.

A solar cell is nothing but a PN junction. The plot of short-circuit current (ISC) and open-circuit voltage (VOC) describes the performance of the solar.

The solar panels are classified into three major types; 1. Monocrystalline Solar Panels 2. Polycrystalline Solar Panels 3. Thin-film Solar Panels.

The solar power plant is classified into two types according to the way load is connected. 1. Standalone system 2. Grid-connected system .

A system converts the Sun's , in the form of light, into usable . It comprises the solar array and the balance of system components. PV systems can be categorized by various aspects, such as, vs. systems, building-integrated vs. rack-mounted systems, residential vs. utility systems, vs. centralized systems, rooftop vs. ground-moun.

The early development of solar technologies starting in the 1860s was driven by an expectation that coal would soon become scarce, such as experiments by . installed the world's first rooftop photovoltaic solar array, using 1%-efficient cells, on a New York City roof in 1884. However, development of solar technologies stagnated in the early 20th centu.
