

Power System Microgrid Load Transfer

Overview

What is Microgrid technology?

It is a small-scale power system with distributed energy resources. To realize the distributed generation potential, adopting a system where the associated loads and generation are considered as a subsystem or a microgrid is essential. In this article, a literature review is made on microgrid technology.

How do microgrids work?

Microgrids are operated either in grid-connected mode where power is exchanged with the main grid based on demand and supply [3, 4] or in island mode where the microgrid acts as a power hub supplying the loads connected to it [5, 6].

Why is microgrid important in Smart Grid development?

Microgrid is an important and necessary component of smart grid development. It is a small-scale power system with distributed energy resources. To realize the distributed generation potential, adopting a system where the associated loads and generation are considered as a subsystem or a microgrid is essential.

How does a diesel generator control a microgrid?

In the island mode, the diesel generator provides reactive power to regulate the voltage and maintains a constant speed irrespective of the load to regulate the microgrid frequency. The simulation results show that the distribution generators (PV and wind) supply the maximum active power and zero reactive power during normal operation.

Why is power flow management important in microgrid development?

It addresses the challenges and opportunities in microgrid development, including the role of distributed generation (DG) systems, voltage source inverters, and the optimization of hybrid AC-DC systems. This chapter

underscores the significance of effective power flow management in ensuring system stability and reliability.

How a distribution management system helps a microgrid & utility grid?

Technical and economical regards are considered via distribution management system to power flow in the microgrid and utility grid to reduces the generation cost in consideration with power balance of the distributed line. Moreover, the distributed system exchanges relevant information by the operator to make a possible decision.
