

Power generation of one solar cell

Overview

Solar cells can be made of a single layer of light-absorbing material (single-junction) or use multiple physical configurations (multi-junctions) to take advantage of various absorption and charge separation mechanisms. Solar cells can be classified into first, second and third generation cells.

A solar cell or photovoltaic cell (PV cell) is an electronic device that converts the energy of directly into by means of the . It is a form of photoelectric cell, a device whose electrical characteristics.

The was experimentally demonstrated first by French physicist . In 1839, at age 19, he built the world's first photovoltaic cell in his father's laboratory. first described the "Effect of Light on Selenium during the passage of an.

A solar cell is made of , such as , that have been fabricated into a . Such junctions are made by one side of the device p-type and the other n-type, for example in the case of silicon by introducing small.

Solar cells are typically named after the they are made of. These must have certain characteristics in order to absorb . Some cells are designed to handle sunlight that reaches the Earth's surface, while others are.

Assemblies of solar cells are used to make that generate electrical power from , as distinguished from a "solar thermal module" or "solar hot water panel". A solar array generates using . Vehicular applications .

Adjusting for inflation, it cost \$96 per watt for a solar module in the mid-1970s. Process improvements and a very large boost in production have brought that figure down more than 99%, to 30¢ per watt in 2018 and as low as 20¢ per watt in 2020. .

Solar cell efficiency may be broken down into reflectance efficiency, thermodynamic efficiency, charge carrier separation efficiency and conductive efficiency. The overall efficiency is the product of these individual metrics. The
