

Probe energy

Overview

Can a UV probe be used for time- and angle-resolved photoemission spectroscopy?

Abstract: We present a detailed exposition of the design for time- and angle-resolved photoemission spectroscopy using a UV probe laser source that combines the nonlinear effects of η -BaB₂O₄ and KBe₂BO₃F₂ optical crystals.

How many EV does a probe laser have?

The photon energy of the probe laser can be switched between 6.0 and 7.2 eV, with the flexibility to operate each photon energy setting under two distinct resolution configurations. Under the fully optimized energy resolution configuration, we achieve an energy resolution of 8.5 meV at 6.0 eV and 10 meV at 7.2 eV.

What is a probe pulse?

The probe pulse is a WLC generated by focusing the output of a homemade NIR Optical Parametric Amplifier (OPA) centered at 1 eV into a YAG plate; the WLC spectrum extends from 1.2 to 2.3 eV, covering A/B intralayer and ILX of the HS (Supplementary Fig. 2a).

How do I contact the probe group?

CONTACT US National Share Call: +27 86 111 3507 Telephone: +27 11 453 0924 Facsimile: +27 11 453 2141 Email: Help us keep the Probe Group great! Report fraud, corruption, or any other misdemeanour anonymously now.

Where is probe group located?

How does a WLC probe work?

The WLC probe beam is generated in an yttrium aluminum garnet (YAG) crystal pumped by a 1 eV pulse and spans a broad spectral window (1.2–2.3 eV) that includes both intralayer excitons and the ILX of the HS (Supplementary Fig. 2a).

Energy

Pollution Probe and QUEST's Innovation Sandboxes project aims to collaboratively create frameworks for innovation in energy systems across Canada. These foundational frameworks can then be used by policymakers, regulators, and other stakeholders to change or replace existing policies and regulations and build programs to accelerate the transition to a low-emissions future.
