Can Floating photovoltaic systems be used in aquaculture ponds?

Use the link below to share a full-text version of this article with your friends and colleagues. Establishing floating photovoltaic (FPV) systems on aquaculture ponds can reduce demand for land use and affects food and solar energy production.

Do floating PV panels affect aquatic life?

To meet the surge in solar energy demand, deployment of PV panels on water surfaces has emerged as an attractive option. Despite the potential advantages associated with floating PV (FPV) systems, current understanding of their impact on aquatic life remains scarce.

Can FPV systems be used in aquaculture ponds?

The application of FPV systems on aquaculture ponds (aquavoltaics) would greatly extend the area where the production of renewable energy becomes feasible.

Are Floating photovoltaic systems sustainable?

Floating photovoltaic systems (FPV) can be a more sustainable alternative for the energy transition than ground-mounted photovoltaic systems, as they avoid occupying useable land and the power generation is more distributed.

What are the limitations of FPV pond simulation?

One of the limitations in the simulation comes from the ponds morphology and the water level variations. When the ponds are much lower than their capacity, but the system was designed to cover 100% of the water surface, although the FPV system is prepared to lay down on the pond's walls, mismatch losses may appear among the PV arrays.

Can floating photovoltaics reduce land-use conflicts?

An emerging solution to mitigate land-use conflicts while still meeting future solar energy goals has been to deploy PV panels on the surface of aquatic ecosystems such as lakes, reservoirs, lagoons, atolls and coastal seas—an innovative approach known as floating photovoltaics or “floatovoltaics” (FPV) (Sahu et al., 2016; Essak & Ghosh, 2022).
