## Overview

What is operation & maintenance (O&M) of photovoltaic (PV) systems?

This guide considers Operation and Maintenance (O&M) of photovoltaic (PV) systems with the goal of reducing the cost of O&M and increasing its effectiveness. Reported O&M costs vary widely, and a more standardized approach to planning and delivering O&M can make costs more predictable.

Why is maintenance management important for PV power plants?

Therefore, maintenance management is essential for reliable and effective operation of PV power plants, ensuring uninterrupted system operation and minimizing downtime. Compared to well-established technologies such as hydro, thermal, and wind, the O&M processes for PV systems are not yet fully structured in many operating companies .

How do I manage a fleet of PV systems?

Operating and maintaining a fleet of PV systems requires active resource management and data acquisition and analysis by the asset and operation manager(s). Outsource the service to a specialized third-party O&M provider.

How do you outsource a PV system?

Outsource the service to a specialized third-party O&M provider. Often a mix of these three strategies is chosen, depending on the age of the PV system, provider's business model, system composition (either commercial or residential), fleet geographic density/distribution, and strengths of the available resources in-house.

Can a ballasted PV system be maintained?

Roofing Material: Maintenance of a ballasted PV system is affected by the type of roofing material. Coal tar pitch, styrene-butadiene-styrene (SBS) modified bitumen, or other soft materials may be damaged by the pressure of a ballasted system, although suppliers of those roofs have introduced products

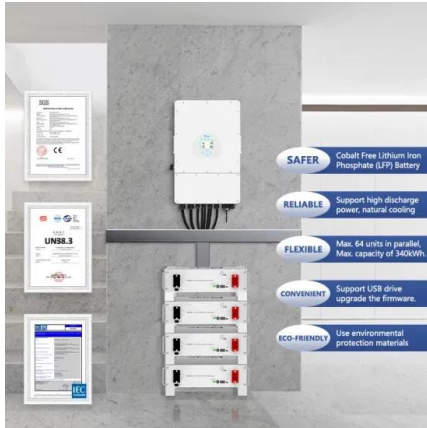

and methods to accommodate ballasted PV.

Are compressed air energy storage systems a viable alternative to conventional throttling valves?

Arabkoohsar et al. (2016) present the use of compressed air energy storage systems. This represents an alternative to classic storage systems. The study shows that substations in the vicinity of the city are a suitable place to produce electricity using turbo-expanders instead of conventional throttling valves.
