

Seasonal adjustment of photovoltaic panels

Overview

Why do solar panels have tilt angles based on seasonal variations?

Adapting tilt angles based on seasonal variations ensures consistent energy production year-round. Seasonal variations play a crucial role in determining the optimal tilt angles for solar panels, owing to the Earth's axial tilt. The Earth's axis is tilted at an angle of approximately 23.5 degrees relative to its orbital plane around the Sun.

When should a solar panel be adjusted?

In some cases, a solar panel should be adjusted throughout the year to account for the changing position of the sun. In general, the tilt angle is steeper during the winter months (when the sun is lower in the sky) and flatter during the summer months (when the sun is higher).

Does solar panel tilt angle affect solar radiation collected?

It has been determined that the collected solar radiation is the highest in the monthly changes of the solar panel tilt angle. It was marked that the collected solar radiation decreased in the seasonal and annual solar panel tilt angles, respectively.

How do I choose the best tilt & angle for solar panels?

For optimal performance and energy yield, it is essential to adjust the tilt and angle of solar panels based on the location, time of year, and other factors. The best tilt for a solar panel is typically equal to the geographic latitude of the installation site.

Why does the tilt angle of PV panels change?

The optimum tilt angle at the same location changes periodically (Fig. 7) due to the Earth revolution around sun. In summer, when the sun shines more directly on the northern hemisphere, the tilt angle is generally small; winter is the opposite. Adjusting the tilt angle of PV panels according to the season

helps capturing more energy.

Should solar panels be tilted to maximize power generation?

To maximize power generation, tilt angle should be adjusted to ensure that PV panels are exposed to direct sunlight. Although sun-tracking system can track sunrays in real time to approach the best tilt angle, the investment is too expensive (or not economical) for both residential users and large solar farms [6, 7].
