

Sensible thermal energy storage systems

Overview

What is sensible thermal energy storage?

Theoretical background Sensible thermal energy storage is the simplest and maturest way to store heat (Becattini et al., 2017). Sensible energy is stored by changing temperature of sensible thermal energy storage materials (STESM) such as water, oil, rock beds, bricks, sand, or soil etc. Fig. 3 shows the typical sensible heat storage diagram.

What are sensible and latent thermal energy storage?

Sensible, latent, and thermochemical energy storages for different temperatures ranges are investigated with a current special focus on sensible and latent thermal energy storages. Thermochemical heat storage is a technology under development with potentially high-energy densities.

Is sensible heat a good energy storage technology?

Sensible heat is the most advanced technology as far as thermal energy storage is concerned. But it still holds a few demerits, such as low storage capacity, which in turn increases the system size (Tian and Zhao 2013). When materials change from one phase to another, they release or absorb energy.

What is a thermal energy storage system?

By heating (or cooling) a storage medium, thermal energy storage systems (TES) store heat (or cold). As a result, further energy supply is not required, and the overall energy efficiency is increased. In most cases, the stored heat is a by-product or waste heat from an industrial process, or a primary source of renewable heat from the sun.

What is sensible heat storage method?

TES uses the internal energy of materials to store sensible, latent and thermochemical heat (Romani et al., 2019, Xu and Wang, 2019). In sensible heat storage method, thermal energy due to temperature change in the storage

material is utilized.

What is a sensible heat system?

Sensible heat systems with solid or liquid salt materials can store thermal energy in the range of 200–500 °C, which makes them applicable for MSF and MED desalination processes. Phase change storage mediums are as commonly used as sensible heat materials.

Thermochemical TES systems have higher energy densities compared to sensible and latent TES systems, hence can provide denser energy storage compared with sensible and latent TES systems (Bales 2006; Hadorn 2005).Kato et al. studied the suitability of metal hydroxides as a medium temperature medium for thermochemical TES systems.
