

# **Serrated blades of wind turbines**

## Overview

---

Do trailing-edge serrations affect a wind turbine?

The influence of the trailing-edge serrations on an operating wind turbine has been quantified in terms of total loads and energy production. The power curves with and without the trailing-edge installations are further analyzed and compared with the theoretical predictions. 1. Introduction.

Do serrations affect power production of wind turbines?

Predictive law used for extending the serrations influence to the whole blade  
Theoretically, serrations have positive impact on power production of wind turbines  
Theoretically, serrations increase wind turbine loads and reduce its life-time  
Positive impact of serrations on power production of real machines has been probed.

Does a serrated blade affect the power production of a wind turbine?

To analyze the influence of the serrated blade on the power production of the wind turbine a dynamic power curve based on the IEC 61400-12 Ed. 1.0 guidelines [ 16] has been performed. Several cases for each wind speed from 3.5 m/s to 25 m/s each 0.5 m/s using different wind seeds have been simulated in normal operation.

Can serrations be used in wind turbines?

Overall, a carefully thought-out configuration of the serrations is possible to significantly reduce the loss of the aerodynamic efficiency and power generation of a wind turbine in particular operating conditions. The focus of this research is to obtain an optimum configuration of serrations for the application of wind turbines.

Can trailing-edge serrations reduce airfoil self-noise emitted by wind turbine blades?

The use of trailing-edge serrations for mitigating the airfoil self-noise emitted

by wind turbine blades has become very popular in the wind energy industry.

Why is blade root important in a wind turbine?

This aspect is particularly important in the design phase of the wind turbine. For the blade root, the maximum increments are caused by a different load case, a power production plus occurrence of faults in the protection or internal electrical systems.

## Serrated blades of wind turbines
