

Ship Microgrid Design Simulation

Overview

Can a real-time simulation support the design of a new microgrid?

The aim of work is the development of a real-time simulation setup in order to support the design of a new microgrid. The ship model, studied and developed for a specific application, considering both electrical and ship dynamics, has been implemented in Matlab/Simulink environment and deployed on Opal-RT simulator [22].

What is a ship microgrid?

The ship is a microgrid with interconnected loads (propulsion, C4ISR, propulsion and auxiliary) and distributed energy resources (power generation, distribution and energy storage) acting as a controllable entity. This is not a new concept.

Can a shipboard microgrid model reproduce real operating conditions?

The shipboard microgrid model shows its capability to reproduce real operating conditions including ship dynamics within the electrical power system study.

Can a DC shipboard microgrid support a RORO Pax retrofitting project?

The paper presents the development of a real-time simulation framework of a DC shipboard microgrid, realized to support the retrofitting project of a RORO Pax vessel with a model-based design approach.

Can a multiphysics simulation simulate a DC electric ship?

In this context, this paper illustrates in detail the development of a multiphysics simulation framework, able to mimic the behaviour of a DC electric ship equipped with electric propulsion, rotating generators and battery energy storage systems.

How can MBD support microgrid design?

In this context the adoption of MBD can support the microgrid design phases [11], which typically are: (1) definition of the system layout and voltage levels, (2) load analysis, (3) generators and storage sizing, (4) distribution system and cables sizing, (5) fault current analysis and protection schemes selection.
