

# Should the generator room be designed with exhaust

## Overview

---

The genset and its equipment (control panel, fuel tank, exhaust silencer, etc.) are integral together and this integrity should be considered during the design phase. The genset room floor should be liquid-tight to prevent leakage of oil, fuel, or cooling liquid into nearby soil. The generator room design must also comply.

The door width/height of the genset room should be such that the genset and its equipment can easily be moved into the room. Genset equipment.

Ventilation of the genset room has two main purposes. They are to ensure that the life-cycle of the genset does not shorten by operating it correctly and to provide an environment.

The exhaust system (silencer and pipes) is installed to reduce the noise from the engine and to direct the toxic exhaust gases to appropriate.

The fuel tank design must comply with fire protection requirements. The fuel tank should be installed in a concrete or metal bund. The ventilation of the tank should be carried outside of the.
