Spanish renewable energy giant and offshore wind energy leader Siemens Gamesa Renewable Energy last week inaugurated operations of its electrothermal energy storage system which can store up to 130 megawatt-hours of electricity for a week in volcanic rock. How will Siemens Gamesa use its storage technology in commercial projects?

In a next step, Siemens Gamesa plans to use its storage technology in commercial projects and scale up the storage capacity and power. The goal is to store energy in the range of several gigawatt hours (GWh) in the near future. One gigawatt hour is the equivalent to the daily electricity consumption of around 50,000 households.

How much storage capacity will Siemens Gamesa have in the future?

The goal for the near future is to expand the storage capacity from today's maximum of 130 MWh to several gigawatt hours. After the testing phase in Hamburg is completed, Siemens Gamesa will initiate a next phase project to bring the storage capacity up to 1 GWh.

How much energy does Siemens Gamesa generate a year?

Siemens Gamesa turbines generate more than 127 GW of wind power all over the world - enough clean energy to power 117 million households. 335 million tons of CO₂ are avoided each year through installed wind turbines from Siemens Gamesa, compared to fossil fuel power generation.
