

Silver mud in photovoltaic panel factory

Overview

The characterization of the EoL 1st generation PV chemical extract, resulting from EoL Hyundai MSI photovoltaic units, is given in Table 1. The analytical process that preceded the generation of the chemical extract is described elsewhere. The EoL PV module is dismantled and fragmented, followed by heating at 550 °C.

For this work, a dual-chamber MFC was constructed, made of polytetrafluoroethylene (PTFE). The two chambers were separated.

The cell voltage was recorded every 2 min by (Agilent Keysight 34972A LXI Data Acquisition/Switch Unit). A Potentiostat–Galvanostat.

Initially, three synthetic solutions were examined in the MFC cathode, which simulated the pretreated and diluted chemical extract. Specifically, the three synthetic solutions individually contained 200 ppm Ag (R1), 50 ppm.
