

# Solar option

## Overview

---

What is solar energy?

Solar energy is the conversion of sunlight into usable energy forms. Solar photovoltaics (PV), solar thermal electricity and solar heating and cooling are well established solar technologies.

What are the different types of solar energy technologies?

There are two main types of solar energy technologies—photovoltaics (PV) and concentrating solar-thermal power (CSP). You're likely most familiar with PV, which is utilized in solar panels. When the sun shines onto a solar panel, energy from the sunlight is absorbed by the PV cells in the panel.

What does it mean to go solar?

When you "go solar," you get a solar panel system installed on your property--usually on your home's roof, but sometimes on your land with ground-mounted solar. Why go solar?

Homeowners go solar for all sorts of reasons. Solar panels reduce your energy bills, minimize your reliance on fossil fuels, and increase your independence from your utility.

Does going solar cost a lot?

Thanks in part to Solar Energy Technologies Office (SETO) investments, the cost of going solar goes down every year. You may be considering the option of adding a solar energy system to your home's roof or finding another way to harness the sun's energy.

Should I add a solar energy system to my roof?

You may be considering the option of adding a solar energy system to your home's roof or finding another way to harness the sun's energy. While there's no one-size-fits-all solar solution, here are some resources that can help you

figure out what's best for you. Consider these questions before you go solar.

Should you install a solar plus storage energy system?

The main advantage of installing a solar plus storage energy system is that it gives you the ability to use solar electricity even when the sun isn't shining. When you install a solar panel system without a battery, excess electricity that your system generates is sent back to the grid.
