## Overview

---

Solar panels are waterproof and can withstand severe downpours due to their careful construction. Do floating solar panels affect water quality?

Although some information is available on the environmental effects of solar panels on land (Turney & Fthenakis 2011; Armstrong et al. 2016; Robinson & Meindl 2019), there is currently little to no knowledge available on the effects of floating solar panels on the quality of the underlying water and local environment.

Are floating solar panels a sustainable solution?

Solutions that can support multiple sustainability goals related to clean energy, and resource use efficiency, will be crucial in the near future. The study estimates the potential of floating solar panels on reservoirs globally to generate renewable energy, reduce water losses and conserve land.

Why do solar panels need a lot of water?

Dust accumulation on solar panels is a major challenge, as it blocks a large portion of sunlight. Solar panels are therefore cleaned regularly using large quantities of pure water. Consumption of water for cleaning, especially in deserts, poses a substantial sustainability challenge.

Can solar panels be submerged in water?

The exterior of solar panels is pretty well sealed with just aluminum and glass, so solar panels themselves are not a concern when it comes to sitting in water. However, the wiring should not be submerged, and it's generally not recommended to install solar panels on roofs if other options are available.

Can floating solar panels be used on water storage reservoirs?

Application of floating solar panels on water storage reservoirs should preferably have no or negligible negative effects, or a net beneficial effect. This is especially important for Evides as the largest storage reservoirs ('De

Gijster' and 'Honderd en Dertig') are located in a Natura 2000 area.

How can solar panels be cleaned?

The most common method of cleaning is using pressurized water jets and sprays (19). Since water is scarce in desert regions, it has to be transported from elsewhere before being sprayed onto solar panels. Water-based cleaning contributes up to 10% of the operation and maintenance cost of solar farms based on cleaning frequency (12, 21).
