## Overview

---

The environmental crisis currently hitting the world has called for all sectors to play their part in cutting down emissions and limit climate change. The railway industry boasts a relatively advantageous starting point in this context, contributing to only a small percentage of emissions globally and representing one of the.

Solar-powered trains are usually put in motion by placing photovoltaic panels close to or on rail lines; they can generate enough electricity to.

Yet, while solar PV could soon land in underground networks around the world, it might still be a while before it is applied to large-scale railways. That.

Overall, the future of solar power in the railway industry looks undoubtedly bright, supported by intensive research, ground-breaking companies like Greenrail and Bankset, as well as a.

The idea of attaching solar panels to railway sleepers is also gaining considerable traction across the industry, as it potentially allows for solar PV to work on long routes at relatively low costs. Initiatives within this.
