

Solar power generation in rainy and dry seasons

Overview

Does rain affect solar generation?

There is an apparent dip in solar generation during the heavy rainfall season (SW: Southwest monsoon), and the significant effect of rain on the AC generation is evident in the consecutive years as well. This is in direct correlation with the rainy months that consistently occur during June, July, and August in this climatic zone.

Does rain affect PV power plants during monsoon season?

A lot of utility-scale PV power plants are being installed in tropical regions owing to the increased sunshine hours especially during the summer season. The influence of rain on the performance of PV power plants during monsoon seasons in a tropical climate is not studied in detail.

Does rain affect the energy production of crystalline photovoltaic modules?

In this sense, numerous studies have been performed in the past decades to assess the influence on the energy production of crystalline photovoltaic modules of several factors, such as spectral quality of solar irradiance, temperature, wind speed, soiling, snow etc. but so far the effect of rain appears scarcely investigated.

What is the best weather for solar energy generation?

The ideal weather for solar energy generation is cold, sunny and windy. The Sun provides the energy for the panel and the cold air surrounding the panels keep it cool along with the cooling effect of the wind on the panels, removing any excess heat generated by the instrument itself.

Does solar irradiation increase or decrease electricity generation?

Evidently, electricity generation decreased in the winter and rainy seasons when solar irradiation decreased, and increased in summer when solar irradiation was naturally high (Tables S1 and S3 in the SI). By contrast, SSF

increased in the winter and rainy seasons, and decreased during the summer.

How does irradiance affect solar energy output?

Monthly variation of AC energy output with irradiance during the reference year. The energy output from the solar power plant is naturally low because of the lesser in-plane irradiation observed during the southwest monsoon months, which has got a higher impact on solar radiation received at the site.
