

# Solar power radio shack

## Overview

---

What is a solar-powered ham shack?

In a solar-powered ham shack we have a few common components. Let's go through the job and purpose of each one in our off-grid system. Solar panels, also known as photovoltaic (PV) panels, harness sunlight and convert it into usable electricity. Each panel consists of multiple solar cells made of semiconductor materials, generally silicon.

Are portable solar panels a good option for off-grid Ham shacks?

The portable solar panels serve a dual purpose. In addition to providing lightweight portable solar power in the field, these man-portable panels can be deployed locally for augmenting solar collection at the off-grid ham shack. It's not the most cost-effective method, but does offer some advantages, where adaptable solar collection is needed.

How much solar storage does a ham shack have?

In total, the off-grid ham shack has ~5312 watt-hours of LiFePO4 solar storage available for any grid-down scenario, encroaching upon our community. That is 3072 watt-hours of primary online battery storage, with the rest in reserve.

Should a ham have a solar power station?

Not surprisingly, many hams would like to have it both ways: Powerful enough to do something besides charge batteries or push a QRP radio while compact and light enough to hit the road. There is a DIY answer: The portable solar power station. Having it both ways. almost.

How does an off-grid ham shack work?

Just like our portable ham radio stations, an off-grid ham shack starts with generating and storing energy. That energy can come from a solar panel, hand-crank generator, wind turbine, or some other DC source. In order to keep things simple, we will focus on a solar powered ham shack. Battery storage

Wind turbine.

What voltage does a ham shack use?

In fact, most mobile ham gear will operate from a range of voltages between ~12 to 15 volts. Often, portable ham gear generally operates on voltage ranging from ~9 to 16 volts. Green radios (surplus military radios) generally operate on a range of voltages ~9 to 24 volts. In the ham shack, it is important to keep our gear DC whenever possible.
