What is space based solar power?

A step by step diagram on space based solar power. Space-based solar power (SBSP or SSP) is the concept of collecting solar power in outer space with solar power satellites (SPS) and distributing it to Earth.

Is space-based solar power possible?

The report, prepared by consultants Frazer-Nash with input from European companies such as Airbus and Thales Alenia Space, concludes that space-based solar power is not only technologically possible, it argues that the lifetime cost per megawatt hour could be half that of nuclear power.

Could a space power station be a precursor to solar power?

A collection of LEO (low Earth orbit) space power stations has been proposed as a precursor to GEO (geostationary orbit) space-based solar power. The Earth-based rectenna would likely consist of many short dipole antennas connected via diodes.

What is a solar power satellite?

1968: Peter Glaser introduces the concept of a "solar power satellite" system with square miles of solar collectors in high geosynchronous orbit for collection and conversion of sun's energy into a microwave beam to transmit usable energy to large receiving antennas (rectennas) on Earth for distribution.

Could a solar power satellite be built from lunar materials?

The low cost per pound of lunar materials in O'Neill's vision would be

supported by using lunar material to manufacture more facilities in orbit than just solar power satellites. Advanced techniques for launching from the Moon may reduce the cost of building a solar power satellite from lunar materials.
