Storage is the key to the renewable energy revolution

That is to say, renewable sources only generate when the sun is shining or wind is blowing, while at others times too much energy for the demand level is generated by these sources, causing waste. Second, renewable energy generation does not solve issues stemming from severe weather conditions, where grids may shut off and insufficient energy is generated ...

Hydrogen from water electrolysis

Hydrogen production via electrolysis of water (water splitting reaction) is a means of storing excess electrical energy produced by renewable energy sources. This hydrogen gas may be used directly to produce power via combustion or recombination with oxygen in a fuel cell; it may be injected into the natural gas network; and it may be used as a transport fuel or as a ...

Thermochemical energy storage

Thermochemical energy storage (TCES) utilizes a reversible chemical reaction and takes the advantages of strong chemical bonds to store energy as chemical potential. Compared to sensible heat storage and latent heat storage, this theoretically offers higher energy density with minimum energy loss during long-term storage due to the temperature ...
