

Structural characteristics of microgrid experimental system

Overview

What are the components of microgrid control?

The microgrid control consists of: (a) micro source and load controllers, (b) microgrid system central controller, and (c) distribution management system. The function of microgrid control is of three sections: (a) the upstream network interface, (b) microgrid control, and (c) protection, local control.

What is the nature of microgrid?

The nature of microgrid is random and intermittent compared to regular grid. Different microgrid structures with their comparative analyses are illustrated here. Different control schemes, basic control schemes like the centralized, decentralized, and distributed control, and multilevel control schemes like the hierarchal control are discussed.

What are the studies run on microgrid?

The studies run on microgrid are classified in the two topics of feasibility and economic studies and control and optimization. The applications and types of microgrid are introduced first, and next, the objective of microgrid control is explained. Microgrid control is of the coordinated control and local control categories.

What are microgrid control objectives?

The microgrid control objectives consist of: (a) independent active and reactive power control, (b) correction of voltage sag and system imbalances, and (c) fulfilling the grid's load dynamics requirements. In assuring proper operation, power systems require proper control strategies.

What control techniques are used in microgrids?

Xiao et al. presents a survey of the various control techniques developed for microgrids. Several control strategies have been proposed for microgrids in [93 - 96]. Robust H^∞ control is presented in [97, 98] for the control of two

distributed generation units.

Should microgrids facilitate adaptive control approaches?

Also, being in the vicinity of smart grid systems, microgrids should facilitate adaptive control approaches. The present research in microgrids adopts control approaches that could be imbedded as autonomous parts of each distributed generator, use a central controller or based on agents.
