

Structure of space solar power station

Overview

In 1941, science fiction writer published the science fiction short story "", in which a space station transmits energy collected from the Sun to various planets using microwave beams. The SBSP concept, originally known as satellite solar-power system (SSPS), was first described in November 1968. In 1973 was granted U.S. patent number 3,781,647 for his.

What is space solar power station (SSPs)?

This special issue is dedicated to the field of Space Solar Power Station (SSPS). Proposed by the American scientist Peter Glaser, SSPS is a grand idea to build an extra-large solar power station on the Earth orbit and to transmit electricity to the surface ground wirelessly, such as through microwaves.

What is space-based solar power?

The idea of space-based solar power dates back to as early as 1923 when Russian theorist Konstantin Tsiolkovsky proposed using mirrors in space to concentrate a strong beam of sunlight down to Earth.

Could a space solar power station solve the energy crisis?

The concept of a space solar power station (SSPS) was proposed in 1968 as a potential approach for solving the energy crisis. In the past 50 years, several structural concepts have been proposed, but none have been sent into orbit.

How much power does the International Space Station produce?

They produce more than 20 kilowatts of electricity and enable a 30% increase in power production over the station's current arrays. NASA spacewalker Stephen Bowen works to release a stowed roll-out solar array before installing it on the 1A power channel of the International Space Station's starboard truss structure.

Could a space power station be a precursor to solar power?

A collection of LEO (low Earth orbit) space power stations has been proposed as a precursor to GEO (geostationary orbit) space-based solar power. The

Earth-based rectenna would likely consist of many short dipole antennas connected via diodes.

How much solar power does a space station need?

This is, however, far from the state of the art for flown spacecraft, which as of 2015 was 150 W/kg (6.7 kg/kW), and improving rapidly. Very lightweight designs could likely achieve 1 kg/kW, meaning 4,000 metric tons for the solar panels for the same 4 GW capacity station.
