Overview

What is supplementary combustion energy storage (CAES)?

The operation characteristic of the CAES The traditional CAES, also known as supplementary combustion compressed air energy storage, has a complete operating process including energy storage and energy release, and the operating principle is shown in Fig. 2. The essence of energy storage is to use surplus electricity to compress air.

What is compressed air energy storage (CAES)?

Compressed air energy storage (CAES) is considered to be one of the most promising large-scale energy storage technologies, due to its advantages, such as large energy storage capacity, high system efficiency, long operating life, and small investment .

How supplementary combustion CAES system is classified?

Schematic diagram of the supplementary combustion CAES system. Energy losses inside turbomachinery are usually classified based on flow phenomena and mechanism, including incidence loss, skin friction loss, clearance loss, blade loading loss, mixing loss and so on.

What is the capacity of air storage subsystem?

The capacity of air storage subsystem determines the total capacity of the system, which is a key technology to implement the large-scale storage of high-pressure air. Large-scale CAES plants generally use underground salt cavern or manually excavated underground cave to store compressed air .

What is the two-stage optimization framework of integrated energy system?

Two-stage optimization framework of integrated energy system considering energy storage characteristic was established in Ref. [26]. Existing researches are focused on the involvement of batteries in operation of IES, without taking into account the various energy storage devices, such as a

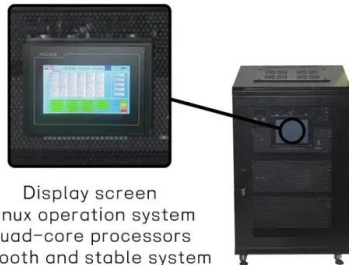

P2G, and a compressed air energy storage.

How does compressed air energy storage work?

Another point that needs to be explained for CAES is that compressed air energy storage has the ability to switch working conditions quickly. The working condition conversion from maximum power generation to maximum compression power can be realized within 5 min, and the start-up time of the power generation mode is about 11 min [45].
