

The whole story of the Bancheng photovoltaic incident

Overview

Are photovoltaic power systems causing fires?

There have been reports linking photovoltaic power systems (PV) with fires in the media over the past few years. With the prevalence of PV systems now in the UK, an increase in incident reports is to be expected.

Is there a rise in PV incidents in the UK?

With the prevalence of PV systems in the UK now, an increase in incident reports is to be expected according to the National Statistics website. As of the end of November 2016, overall UK solar PV capacity stood at approximately 11 GW.

How did a fire affect a solar PV system?

A localised fire caused damage to areas surrounding the point of origin of the fire, mainly affecting PV system components. However, the fire did not spread beyond that or threaten the building.

Why was a solar panel stranded on a roof?

Preliminary investigations revealed that the cable was lying on the roof, which was wet due to rain before the incident. Figure 1: Scene of the accident. Electrocution is a major concern during the installation of solar panels. Solar panels generate live current when exposed to sunlight, even when they are not plugged in.

Can PV systems be used to fight fires in the UK?

Notwithstanding these regimes for installers and products, there is currently no national UK guidance specific to fighting fires involving PV systems, despite PV systems presenting new risks to firefighters, especially from the risk of electric shock and electrocution.

What happened to the three inverters used for the solar plant?

The three inverters used for the solar plant. Maintenance teams quickly identified the source of the fire. Indeed, traces of wear on the cables that connect the modules to the transmission terminals had been observed since October 2021.
