

Tokyo Tower uses solar energy to generate electricity

Overview

Tokyo Tower uses 100% of the electricity it uses to light up the tower every night, using electricity generated by the Kanoyama Solar Power Plant in Kimitsu City, Chiba Prefecture. What is a solar power tower?

A solar power tower, also known as 'central tower' power plant or 'heliostat' power plant, is a type of solar furnace using a tower to receive focused sunlight. It uses an array of flat, movable mirrors (called heliostats) to focus the sun's rays upon a collector tower (the target).

What is Japan doing with solar power?

Japan is making steady progress toward the practical implementation of both. The SBSP project involves the space launch of satellites equipped with giant solar panels measuring 2 km², converting the generated electricity into microwaves that are then transmitted wirelessly to the ground.

How do solar power towers work?

Traditional solar power towers are constrained in size by the height of the tower and closer heliostats blocking the line of sight of outer heliostats to the receiver. The use of the pit mine's "stadium seating" helps overcome the blocking constraint.

Can a water tower create electricity?

The quick and dirty answer to your question is yes. You could create electricity using the potential energy of the water stored in the water tower of height (h meters). HOWEVER, you would also have to consider the amount of energy that would be needed to pump the same volume of water to a height of h meters.

Can Japan harness the potential of solar power?

Japan's efforts to harness the potential of solar power, a well-known renewable energy source, will shine a light on humanity's future. Japan is

making steady progress toward the implementation of the groundbreaking technologies of both space-based solar power and flexible solar cells.

Can a solar cell be used as a water tower / turbine / pump?

When you add a solar cell to the water tower / turbine / pump scheme, what you essentially have is a solar power system employing a water tower as an energy storage device. Such a system could store collected solar energy by pumping water up into the tower, and when the sun isn't shining, the system can still produce power from the turbine.
