Can solar panels generate electricity at night?

Stanford engineers create solar panel that can generate electricity at night  
While standard solar panels can provide electricity during the day, this device can be a "continuous renewable power source" during the day and at night. A team of engineers at Stanford University have developed a solar cell that can generate some electricity at night.

How do solar panels work?

It works by tapping into the heat being radiated from the surface of the solar cells as infrared light into outer-space on clear nights. By incorporating a thermoelectric generator into a conventional PV solar panel, the scientists achieved 50 mW/m<sup>2</sup> nighttime power generation.

Could a new solar cell improve nighttime power generation?

The Stanford team plans to engineer new solar cells to improve the nighttime power generation and also plan to scale up their prototype. Cost could be one barrier to scaling up the idea, since TEGs are typically made of expensive materials.

Can a solar system provide nighttime standby lighting and power?

"Our approach can provide nighttime standby lighting and power in off-grid and mini-grid applications, where [solar] cell installations are gaining popularity," the study said. Mini-grid applications refer to independent electricity networks. These can be used when a population is too small or too far away to extend the grid.

Can a TEG power a solar panel at night?

The other side of the TEG connects via a heat sink to ambient air. While existing solar panels could be retrofitted with a TEG to produce power at night, Fan says, the crucial thing for the devices to work well together is to

have very close thermal contact between solar cells and the TEG, a challenge that retrofit solutions will have to overcome.

How does a photovoltaic cell work?

Researchers at Stanford University created a photovoltaic (PV) cell that uses a process called radiative cooling to allow for 24 hour renewable energy generation. It works by tapping into the heat being radiated from the surface of the solar cells as infrared light into outer-space on clear nights.
