

# What happened to the black spots on the photovoltaic panels

## Overview

---

If you see dark spots on your panels, this could be a sign that your panels are undergoing delamination, and you should contact your installer for an inspection. Why do I have dark spots on my solar panels?

Without a secure seal, moisture and air can enter the system, causing corrosion and substantially reducing panel performance. If you see dark spots on your panels, this could be a sign that your panels are undergoing delamination, and you should contact your installer for an inspection.

What causes hot spots on solar panels?

Hot spots, one of the most common issues with solar systems, occur when areas on a solar panel become overloaded and reach high temperatures relative to the rest of the panel. When current flows through solar cells, any resistance within the cells converts this current into heat losses.

How do hotspots affect solar panels?

Power generation in solar photovoltaic systems is indirectly proportional to the solar panel's temperature. Hence, in extreme heat, solar energy output goes down. Hotspots are generally developed because of overheating. So, leaving space for air circulation can significantly reduce the effects of hotspots on solar panels.

How to prevent solar panel hotspots & ensure solar panel efficiency?

Below are the three critical factors that will help prevent solar panel hotspots and ensure solar panel efficiency. The first and foremost factor should be considered while deciding on the site location. A complete study and site testing are mandatory before installing your solar panels.

How do you know if a solar panel has a hotspot?

Solar panel hotspots are usually not visible to the naked eye, but that doesn't mean they're not there. It may either appear as noticeable damage on the

surface or as a visible brown spot on the solar panel. A good way to detect them is through thermography.

What does a dark area on a solar panel mean?

Darker areas indicate module faults or defects, while darkest areas correspond to module power loss due to severe solar cell cracks. GPOA: measured plane of array irradiance. Courtesy of Gisele Benatto and Peter Poulsen/DTU. This can be a problem for installations in the field.
