## Overview

---

What is a load center?

Load center is an industry term that applies to the types of panelboards used in residential or light commercial applications. The National Electrical Code® makes no distinction between a panelboard and a load center. Rules and definitions that apply to panelboards also apply to load centers.

How does a load centre work?

Load centres use plug-on circuit breakers to reliably distribute the electricity to circuits throughout a home or small building. “Plug-on” refers to how the circuit breaker connects to the bus bar of the load centre. The load centre can provide safety from ground and arc faults by using specialist or electronic circuit breakers.

What are load centres called?

Load centres have been called different names over the years. For example, a fuse box, breaker box, panelboard or a distribution panel. Historically, homes used fuse panels to distribute power but today, load centres with enclosed circuit breakers are the industry standard. Where are load centres used?

.

What is a load center in a breaker box?

They are also called circuit breaker boxes. Typically, load centers mount on a wall. Power from the mains enters the breaker box and is connected to circuit breakers that distribute power to the building. In this way, load centers are used both for holding the circuit breakers and for electrical distribution.

What are the different types of electrical load centers?

They keep electricity flowing where it's needed while ensuring safety. There are several types of electrical load centers, each serving a specific purpose.

Knowing the difference can help you choose the right one for your home or business. The two main types are Main Breaker and Main Lug load centers. Both distribute power but work differently.

What is a load center in panelboard?

According to this definition, panelboards, including load centers, are: Load centers are constructed of the following three parts: enclosure, interior, and trim. The enclosure is typically constructed of cold rolled steel (for indoor use) or galvanized steel (for outdoor use).
