

What is the high temperature load limit of photovoltaic inverters

Overview

It's well understood that heat affects PV modules – they are tested and rated at 25 degrees Celsius and every degree above that causes power output to drop by up to .5% per degree, depending on the type of semiconductor used. The temperature of the module is directly affecting voltage and the two critical things to.

What is not as well understood is that heat also affects solar inverters. The reasons are not the same – although the solar inverter has semiconductor parts in it which lose efficiency as they heat up, the semiconductors.

As the inverter works to convert DC power to AC power, it generates heat. This heat is added to the ambient temperature of the inverter enclosure, and the inverter dissipates the heat through fans and / or heat sinks. The heat.
