

# **What is the inlet and outlet air temperature of the generator**

## Overview

---

What is the difference between inlet air temperature and outlet air temperature?

The inlet air temperature is the temperature at which air enters the server through perforated tiles, cold aisles, or rack front doors. The outlet air temperature, on the other hand, is the temperature at which air exits the server through rack back doors and hot aisles.

What is inlet air temperature?

The inlet air temperature is the temperature at which air enters the server through perforated tiles, cold aisles, or rack front doors. You might find these chapters and articles relevant to this topic. Yang Cai, . Fu-Yun Zhao, in Applied Thermal Engineering, 2019.

How does a gas generator work?

The gas generator can operate at different speeds from the power turbine, and the power will actually increase as fuel is added to raise the moist air (due to humidity) to the allowable temperature. This fuel increase will increase the gas generator speed and compensate for the loss in air density.

Why does a gas turbine engine need a higher temperature?

The higher temperature allows for increased power and improved efficiency while adding higher cost for the direct cooling of the first turbine stage airfoils and other components. The performance of the gas turbine engine is dependent on the mass of air entering the engine.

What is outlet temperature?

Outlet temperature of the cooling medium: This defines the minimum temperature difference between the saturated vapor in the condenser and the cooling air or the cooling water. You might find these chapters and articles relevant to this topic. U. Herrmann, . C. Prah, in The Performance of

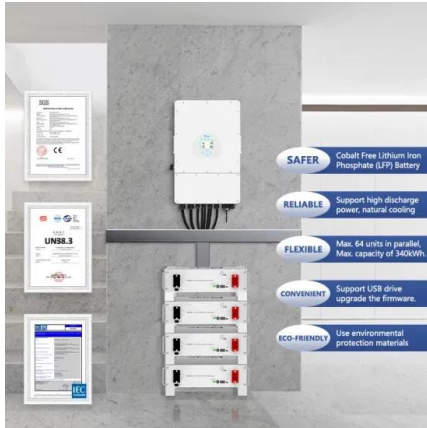

Concentrated Solar Power (CSP) Systems, 2017.

Why does the control system follow the inlet air temperature function?

This occurs because the density loss to the air from humidity is less than the density loss due to temperature. The control system is set to follow the inlet air temperature function. By contrast, the control system on aeroderivatives uses unbiased gas generator discharge temperature to approximate firing temperature.
