Overview

Why is accelerated ageing and field performance of PV modules increasing?

The research activity on accelerated ageing and field performance of PV modules has significantly increased during the last decade. The increasing interest finds its causes in the growing market accompanied with the technological development and diversification, along with the rising importance of PV for the financial sector.

Do accelerated ageing tests improve the quality of PV modules?

The Know-How on degradation effects and rates as well as on failure modes of PV modules in the field and related accelerated tests were improved. Accelerated ageing tests, with subsequent characterization, are in general used to ensure and measure the quality of PV components and are used for a long time .

Do PV modules degrade over time?

PV module components degrade over time during operation, which leads to electrical performance loss [7 - 10]. The service life of a PV modules depends mainly on the BoM, PV technology and the climate which the PV module operates in, as these two factors highly influence the type and rate of degradation mechanisms.

What is PV reliability research?

PV reliability research mainly aims at: developing models to predict the degradation rates as well as the service life of PV modules with acceptable accuracy, and to propose lab-based accelerated ageing tests that can simulate near to real-world conditions and their impact on PV modules.

Can accelerated testing predict service life of PV modules?

The final goal of accelerated testing is predicting the service life of PV modules under normal outdoor conditions. The chapter gives an overview on

developments related to service life prediction (SLP) of PV modules using data of accelerated ageing tests and the correlation of these tests with outdoor operation and effects. 8.1.

What factors affect the degradation of PV modules?

The presence or absence of water in the ambience is together with the temperature load one of the main factors for degradation effects. Relative humidity as main driver in several degradation mechanisms e.g. corrosion, embrittlement, discoloration, optical and adhesion losses directly affect the lifetime and energy yield of PV modules.
