

What planet is close to the moon right now

Overview

From October 28 to November 3, the Moon will visit the constellations Leo, Virgo, Libra, and Scorpio. This week, the brightest dot near the Moon will be Mercury (mag -0.3). The most prominent star near our natural satellite will be Spica (mag 1.0) from Virgo. As the New Moon occurs this week (on November 1), the lunar.

In this article, you'll come across several types of celestial events. They all involve the relative positions of the Moon and celestial objects and occur close together in time. However, they.

*The percentage of Moon illumination is for London. To find out the Moon illumination percentage for your location, check the lunar calendar.

About 45 minutes after sunset on Monday, look toward the southwest horizon to see Venus hovering near to the moon; an eye-catching tableau in spite of the pair's low altitude. Which planets will be visible on November 17 & 20?

On November 17, the 98%-illuminated Moon and Jupiter (mag -2.8) will meet in the constellation Taurus. The planet will rise in the evening and will be visible to the naked eye. On November 20, the 77%-illuminated Moon and Mars (mag 0.2) will meet in the constellation Cancer. The planet will rise in the evening and will be visible to the naked eye.

When can you see the Moon & Mars?

October 20 - The Moon rises near Jupiter, with the giant planet looking extremely bright. You should be able to find them low in the east after around 10 pm. October 23-24 - Early risers will be able to spot Mars together with the Moon, high overhead in the south both mornings.

Is a bright object near the Moon a star or a planet?

A bright object near the Moon can be a star or a planet. You can tell the difference by checking if the object twinkles. If it does, then it's a star; if not, it's a planet. Also, Jupiter and Venus (sometimes Mars and Saturn, too) are way brighter than most stars.

Will Uranus & the full moon meet on November 15?

On November 15, the Full Moon and Uranus (mag 5.7) will meet in the constellation Taurus. The bright Pleiades star cluster will also shine nearby. The planet will appear in the sky in the evening. Note that Uranus is rather faint to be observed without any optical aid, so it's best to bring a pair of binoculars.

How do I view planets and stars near our natural satellite?

To view the planets and stars near our natural satellite, choose a cloudless night and use Star Walk 2 or Sky Tonight to learn when the celestial objects are best placed for your location. For a visual explanation, watch our recently released video on how to identify bright objects near the Moon using the Sky Tonight app, step by step.

Where can I find a full moon on October 20th?

On the 13th and 14th after dark, look for the nearly full Moon with Saturn toward the southeast. Then on the evening of October 20th, the Moon rises near Jupiter, with the giant planet looking extremely bright. You should be able to find them low in the east after around 10 pm that night.

What planet is close to the moon right now

[What Planet Is Next to the Moon Tonight](#)

On October 25, 2022, at 08:00 GMT (4:00 a.m. EDT), three hours before the solar eclipse, the New Moon will come close to Venus and occult it. Both objects will be in the constellation Virgo. The planet will be right next to the Sun and, therefore, unobservable.
