

# Wind turbine blade cover

## Overview

---

What is a fabric-covered wind turbine blade?

Recently, researchers at General Electric Co. proposed a new wind turbine blade concept, which is called fabric-covered. The design is composed of metal or composite spars, ribs, and covering fabrics that work to decrease the blade's overall weight.

What is a nacelle cover for a wind turbine?

Resin-infused, glass fiber composite nacelle covers. As the demand for larger and more powerful wind turbines continues to rise, wind turbine manufacturers like Suzlon Group continue to investigate ways to optimize their structures and processes.

How long do wind turbine blades last?

Since wind turbine blades are built to last over 2 decades, this erosion exposes the fiberglass beneath and ultimately impacts the blade's life causing the turbine to produce less energy over time.

Why do wind turbines need longer blades?

To meet rising demand for renewable energy, larger and more powerful wind turbines, with longer turbine blades, continue to be developed and installed.

Do wind turbine blades need reengineering?

Wind turbine blades, as increasingly large, all-composite structures, are understandably a target for cost reduction, but they are not the only composite components on wind turbines that may require some reengineering as the industry steps up to meet demands for renewable electricity with a low LCOE.

What is a turbine nacelle?

The nacelle refers to the protective cover on top of the tower which houses the turbine drivetrain (including the generator, gearbox, and low- and high-speed shafts). Although under considerably less severe loading than the turbine blades, the nacelle also commonly uses GFRP in sandwich construction.
