

Wind turbine generator components

Overview

The main support tower is made of steel, finished in a number of layers of protective paint to shield it against the elements. The tower must be tall enough to ensure the rotor blade does not interfere with normal day-to-day operations at ground level (for instance with turbine shadow flicker). A smaller, on-shore 2MW wind.

The nacelle is the 'head' of the wind turbine, and it is mounted on top of the support tower. The rotor blade assembly is attached to the front of the nacelle. The nacelle of a standard 2MW onshore wind turbine assembly weighs.

The rotor blades are the three (usually three) long thin blades that attach to the hub of the nacelle. These blades are designed to capture the kinetic energy in the wind as it passes, and.
