## Overview

How a lumped generator is used in a wind turbine system?

In the wind turbine system, the lumped generator model gets the power reference and approximate speed reference input from the wind turbine power control system. Based on the reference input, the generator applies the load torque to the wind turbine shaft and supply the electrical power to the grid. where, Here, and are obtained from the PLL.

Are induction generators suitable for small scale vertical axis wind turbine application?

In this the-sis different topologies of electrical generators have been investigated for small scale vertical axis wind turbine application. A two stage induction generator is proposed as a alternative solution with respect to the cost of such a system.

What are the different types of wind turbine concepts?

The wind turbine concepts studied are: (1) fixed-speed squirrel cage induction generator (FS-SCIG); (2) wound rotor induction generator (WRIG) with variable rotor resistance (VRR); (3) doubly fed induction generator (DFIG); and (4) direct drive synchronous generator (DDSG). They are the most commonly applied wind turbine concepts .

How is a wind turbine rotor modeled?

In power system dynamic simulations, the wind turbine rotor is represented by a simplified model derived from the disk actuator theory, and the drive train is commonly modeled by the two-mass model.

How to simulate wind turbine control?

To simulate wind turbine control, you must run the simulation longer. The closed-loop DFIG system is faster than wind turbine control systems such as pitch control. Therefore, a low fidelity lumped DFIG generator system is

practical for improving simulation speed and providing flexibility.

What is a wind turbine drive train?

Drive train system. It represents the mechanical system of the wind turbine, composed of turbine rotor, shafts, gearbox and generator. The drive train model computes the turbine and generator speeds by using the mechanical torque extracted from the wind and the generator torque as input variables. Blade pitch angle control system.
