What is wind turbine cooling?

Wind turbine cooling involving: wind generator, electronic and electric equipment, gearbox and other components cooling. Through the years challenges of cooling systems for wind turbine caused the new cooling systems.

How to cool a wind turbine?

Through the years challenges of cooling systems for wind turbine caused the new cooling systems. A simple way to cooling the turbine is using the small part of inlet air to the nacelle and filling the needed part and finally exhausting the air from nacelle . These days in MW wind turbines use oil or water for cooling.

Do wind turbines need a cooling system?

In order to ensure the secure and stable operation of wind turbine, effective cooling systems has to be implemented to these components. Since the early wind turbines had lower power capacity and lower heat production, the natural air cooling method was sufficient for cooling requirement.

How a wind turbine cooling system works?

In this study, a conceptual design of a new wind turbine cooling system is proposed. In this system, the heat which is generated by wind turbine using a coolant comes to ORC cycle and gives the heat into the refrigerant. After that the coolant goes back to the wind turbine to take the heat.

What are the different types of wind turbine cooling?

Wind turbine cooling is divided two categories air and liquid cooling. The air cooling part includes both natural and force cooling. About 95% if the wind turbine cooling is done by forced air and liquid cooling . There are many types of cooling technologies includes: air-air, liquid-air, air-liquid-air, liquid-liquid-

air, air-liquid-liquid.

Who is the best cooling solution for offshore wind turbines?

In more than 90% of all offshore wind turbines in Europe, a customized cooling solution from Nissens Cooling Solutions has been installed. The majority of the leading wind turbine manufacturers in the world, focusing on offshore wind applications, has chosen Nissens Cooling Solutions as their preferred supplier.
