

Wind turbines on the mountain

Overview

Do wind turbines work on slope hills?

The study projected the wind-turbine wake profile for flat terrain on the hill terrain flow field. As a result, the performance of turbines installed on the windward side of the hill is well predicted. Compared to the gentle slope hill, the recovery of wind turbine wake in the distant wake region was always faster for the steep slope hill.

Can wind turbines be placed on a hill?

However, the power production of these turbines is reduced due to blockage effects when they are placed at the base of the hill. The performance of turbines placed on the windward side of the hill is well predicted by superimposing the wind-turbine wake profile for the flat terrain on the hilly-terrain flow field.

Can wind turbines produce more energy behind hills?

To maximize the exposure of wind turbines, blades are placed atop tall towers on the crests of hills or miles off shore. But a new study has shown how turbines behind hills could actually produce higher amounts of energy than those out in the open.

Does a wind turbine flow over multiple hills?

Flow over multiple hills behaves slightly differently than flow over single hills. When numerous hills are present, the combined hill's geometry determines the overall flow pattern in their vicinity. The integration of the wind turbine model into numerical modeling showed considerable differences.

Should wind turbines be modeled on hills?

Hu's argument is that by modeling turbines on hillsides we can get a more accurate picture of energy potential on hilly or mountainous terrain, since wind farm designs are still based on flat terrains. Hu's group is studying how

the steep [20 to 40 degree] gradients of a hill impact the turbine efficiency.

Does a wind farm have a hill in the middle?

Subsequently, we consider wind farms with a hill in the middle. The hill wake is very pronounced due to which the performance of turbines located behind and close to the hill is mainly determined by the flow dynamics induced by the hill instead of the wind-turbine wakes. Finally, we study a wind farm located between two hills.
